REASON FOR ALLOWANCE

1. Clark et al discloses a car body in a freight carrying, center beam railroad car comprising a cargo supporting floor extending substantially between the opposite sides and the opposite ends; and a center beam extending along said body, said center beam including a center sill extending along the body and a top chord extending parallel with and spaced upwardly above and apart from the center sill, said top chord being adapted to support a load placed on the floor. Kennedy discloses a one piece self sustaining fastener for securing a protective liner to the bed of a pick-up truck including a flexible affixable member, which is a low coefficient friction polyethylene on a load supporting rail member of the truck. Weiner discloses a pallet racking system for a railcar comprising a plurality of center posts, pallet supporting rails mounted on each side of the posts for loading of pallets including a member adapted to resist the load against the posts. Crane et al discloses a load bearing support structure for machinery which provides a mechanism for dissipating both mechanical and vibrational energy comprises a high damping flexible reinforcement of fiber. However, none of the references of record suggests a freight carrier center beam railroad car, wherein the top cord of the center beam includes a selectively affixable member or cover including a lateral face arranged to contact a cargo supported by said floor and resist a lateral displacement thereof in a direction substantially normal to said lateral face in the manner defined in the instant claims 1, 4, 7, 12, 15, 18, and 20 and in combination with other limitations of the claims.
